The BC Coast and Marine Environment project is a collaborative effort between two federal and two provincial ministries and two universities to provide an integrated picture of the environmental condition of the British Columbia coast. Approximately 40 indicators and many secondary measures have been selected through a process of consultation with potential audiences and technical experts. The project deliverables include technical papers on the following themes: Population Pressures, Impacts of Economic Activities, Health of Coastal Ecosystems, Biodiversity, Ecosystem Protection, Fisheries, Climate Change, Industrial Contaminants and Stewardship. Deliverables also include a web site and a paper report on monitoring deficiencies that were identified in the course of the project.
